## vablet® Use Case Study

**Industry: Financial/Global Swiss Bank Client**

**Solution: Mobile File Access, Collaboration**

The bank will initially use their private-labeled version of **vablet** for the Board of Directors meeting. Documents will be securely shared among the Directors prior to company-wide deployment.

The intention of the subsequent deployment of **vablet** (by country), will be collaboration among the investment bankers. They will use it as a tool to share and collaborate on transactions.

As an example, a junior banker will push documents to one or more senior bankers. The senior bankers will view and/or annotate the documents. The edited documents will be saved back to the internal servers as a separate file along with the annotations. The junior banker will then send the new, edited document back out to the deal team.

### Infrastructure

The **vablet** “core” application is installed within the bank’s datacenter using Microsoft’s SQL Server, IIS (web server) and web services. The iPads connect to a border server running SiteMinder which passes requests to the **vablet** core. The **vablet** core application manages the content on each device within a mobile container, as well providing a centralized hub for files and users.

The bank uses Microsoft’s SharePoint® 2010 as its ECM (enterprise content management) software to connect to **vablet**. This solution mitigates Safe Harbor and other geographic restrictions by being flexible enough to respect data security issues on a country-by-country basis. For this reason, the solution can be easily replicated enterprise-wide and in all of the countries that they are doing business.

### vablet Functionality

The content rights management has been integrated with Good for Enterprise® and Documentum® for added utility. **Vablet** provides unique rights to users by allowing functions such as printing, emailing, and auto-expiration on a file-by-user basis. These features are exclusive to the **vablet mobile container**.

### Security

The **vablet** solution has been PEN (penetration) tested and approved for use by a global security firm and has also been approved by the US Department of Commerce and the NSA for export.
